

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method in a data processing system for monitoring transactions for a set of known nodes in a network data processing system, the method comprising:

receiving cache data from a router in the data processing system, wherein the cache data includes an identification of the set of known nodes sending data packets for transactions onto the network data processing system;

identifying the transactions handled by each node in the set of known nodes using the cache data received from the router, to form identified transactions;

analyzing the identified transactions; and

in response to the analyzing the identified transactions, selectively initiating a load balancing process for at least one of the nodes in the set of known nodes to mitigate transaction overload at the at least one of the nodes [[and]]

tracking the transactions for the set of nodes using the cache data from the router.

2. (Original) The method of claim 1, wherein the cache data is from an address resolution protocol cache located on the router.

3. (Original) The method of claim 1 further comprising:
receiving cache data from other routers on the network data processing system.

4. (Currently Amended) The method of claim 1, wherein the receiving step occurs on a periodic basis ~~and further comprising:~~

~~identifying transactions handled by a node in the set of known nodes using the cache data received on the periodic basis from the router.~~

5. (Currently Amended) The method of claim 1 ~~further comprising:~~

~~analyzing usage of each node in the set of known nodes using the cache data wherein the cache data is automatically sent from a daemon process within the router to the data processing system without the cache data being requested by the data processing system.~~

6. (Currently Amended) The method of claim 5 further comprising:
selectively initiating a load balancing process in response to analyzing the usage of each node in the set of known nodes 3, wherein the cache data from the other routers is automatically sent from a daemon process within each of the other routers to the data processing system without the cache data from the other routers being requested by the data processing system.
7. (Original) The method of claim 4 further comprising:
generating a display of the set of known nodes in a graphical view, wherein the graphical view includes the communications paths with a graphical indication of the network traffic.
8. (Original) The method of claim 2, wherein the cache data is received through an agent located on the router.
9. (Original) The method of claim 8, where the agent clears the address resolution protocol cache each time data is sent to the data processing system.
10. (Currently Amended) A data processing system for monitoring transactions for a set of known nodes in a network data processing system, the data processing system comprising:
a bus system;
a communications unit connected to the bus system;
a memory connected to the bus system, wherein the memory includes a set of instructions; and
a processing unit connected to the bus system, in which the processing unit executes the set of instructions to receive cache data from a router in the data processing system, in which the cache data includes an identification of the set of known nodes sending data packets for transactions onto the network data processing system, identifies the transactions handled by each node in the set of known nodes using the cache data received from the router, to form identified transactions; analyzes the identified transactions; and in response to the analyzing the identified transactions, selectively initiates a load balancing process for at least one of the nodes in the set of known nodes to mitigate transaction overload at the at least one of the nodes and tracks the transactions for the set of nodes using the cache data from the router.
11. (Currently Amended) A data processing system, including a data processor, for monitoring transactions for a set of known nodes in a network data processing system, the data processing system comprising:

receiving means for receiving cache data from a router in the data processing system, wherein the cache data includes an identification of the set of known nodes sending data packets for transactions onto the network data processing system;

identifying means for identifying the transactions handled by each node in the set of known nodes using the cache data received from the router, to form identified transactions;

analyzing means for analyzing the identified transactions; and

initiating means for selectively initiating, responsive to the analyzing means for analyzing the identified transactions, a load balancing process for at least one of the nodes in the set of known nodes to mitigate transaction overload at the at least one of the nodes. [[and]]

tracking means for tracking the transactions for the set of nodes using the cache data from the router.

12. (Original) The data processing system of claim 11, wherein the cache data is from an address resolution protocol cache located on the router.

13. (Original) The data processing system of claim 11 wherein the receiving means is a first receiving means and further comprising:

second receiving means for receiving cache data from other routers on the network data processing system.

14. (Currently Amended) The data processing system of claim 11, wherein the receiving means is initiated on a periodic basis ~~and further comprising:~~

~~identifying means for identifying transactions handled by a node in the set of known nodes using the cache data received on the periodic basis from the router.~~

15. (Currently Amended) The data processing system of claim 11 ~~further comprising:~~

~~analyzing means for analyzing usage of each node in the set of known nodes using the cache data wherein the cache data is automatically sent from a daemon process within the router to the data processing system without the cache data being requested by the data processing system.~~

16. (Currently Amended) The data processing system of claim 15 ~~further comprising:~~

~~initiating means for selectively initiating a load balancing process in response to analyzing the usage of each node in the set of known nodes 13, wherein the cache data from the other routers is~~

automatically sent from a daemon process within each of the other routers to the data processing system without the cache data from the other routers being requested by the data processing system.

17. (Original) The data processing system of claim 14 further comprising:
generating means for generating a display of the set of known nodes in a graphical view, wherein the graphical view includes the communications paths with a graphical indication of the network traffic.

18. (Currently Amended) A computer readable medium encoded with a computer program product in a computer readable medium that is operable in a data processing system for monitoring transactions for a set of known nodes in a network data processing system, the computer program product comprising:

first instructions for receiving cache data from a router in the data processing system, wherein the cache data includes an identification of the set of known nodes sending data packets for transactions onto the network data processing system;

second instructions for identifying the transactions handled by each node in the set of known nodes using the cache data received from the router, to form identified transactions;

third instructions for analyzing the identified transactions; and

fourth instructions for selectively initiating, in response to the third instructions for analyzing the identified transactions, a load balancing process for at least one of the nodes in the set of known nodes to mitigate transaction overload at the at least one of the nodes [[and]]

second instructions for tracking the transactions for the set of nodes using the cache data from the router.

19. (Original) The computer program product of claim 18, wherein the cache data is from an address resolution protocol cache located on the router.

20. (Currently Amended) The computer program product of claim 18 further comprising:
[[third]] fifth instructions for receiving cache data from other routers on the network data processing system.
